Hygiene and good sanitation

Community members learn about hygiene and good sanitation practices.

My Education

- Last year, I was in grade..... 6
- This year, I am in grade..... 1
- (If retained, explain).....
- My school is..... 355 meters/km from home
- I am not in school because.....
- I will start school in..... (Year)
- I attend literacy school, my course is.....
- My course will be completed by.....

My Educational level

Secondary school

I want to be.....

Medicine

My school received

- Sanitation kits
- Educational materials

My Health

- I received a mosquito net
- My health status is good
- My health status is not good
- Why?.....

I help my family at home

- Carries water Gardens
- Fire wood Prepare food
- Cleans Herds animal
- Fill oil lamp Shopping

My Favorite.....

- Bird..... poule (Chicken)
- Animal..... chèvre (goat)
- Color..... Vert (green)
- Subject..... Mathématique
- Game..... Goup gance
- Fruit..... Mangue

My Best friend's name is...

Keur Sia

Washing hands has become a common practice among children in school

My supervisor: Habibou Issaka

Dear Sponsor,
Warm greetings on behalf of your sponsor child, his/her family, community and Kassama ADP staff. We really appreciate your time, your love, your assistance and sacrifice commit to support us implementing projects that contribute to the well being of your sponsor child. Your support and your generosity really help Kassama population. Kindly and humbly I would like to share some of our victories this year with you:

WATER, SANITATION, HEALTH & NUTRITION

In the bid to improve access to quality water, three pumps were constructed in two communities (Almari Sofou & Bauraye Oumara). The community people actively participated in the construction of the structures. The hand pumps provide safe drinking water for more than 2000 men, women and children in these communities.

Malaria is one of the common illnesses among women and children. A one day workshop was conducted to train community leaders on the prevention of malaria by learning how to keep their environment clean. Furthermore, 3200 mosquito nets were distributed to registered children in area. Throughout the year, several children fell ill but received support from the ADP for treatment at the Regional hospital.

An adequate knowledge on basic hygiene and sanitation is one of the major challenges which lead to the prevalence of water related diseases and other illnesses. A four day basic hygiene and sanitation practice campaign was conducted in 13 communities. This meeting helped community members to learn about how to keep their environment clean. At the end of the meeting, an action plan was developed by participants who will be implementing the first six months at which point reflection sessions will be conducted to identify best practices, challenges and the way forward.

Children in schools also had little knowledge on hygiene practices. As a result, they handled food with little or no care. After a one day training session at 20 primary schools, children learned basic hygiene and sanitation practices. Also, 20 hand washing kits were distributed to those schools.

In a bid to support immunizations for all people, the ADP provided monthly support to health centers by transporting vaccination teams to difficult terrains where people don't usually receive treatment. Almost 2000 children were vaccinated against measles and polio. This will greatly contribute to the prevention of child deaths. Community sensitization sessions were also carried out in those communities to show the importance of immunizations especially for children under five and pregnant women. Records from the various health posts show that more people as a result of the sensitizations are now bringing their children for immunization. These activities have contributed to the increased number of children been immunized against polio and measles.

EDUCATION

Improving on the quality of basic education in the ADP community is the overall objective of the Kassama education project with the following outcomes: Enhanced teaching and learning environment for teachers and pupils, increased number of children enrolled and retained in schools as well as the community being fully aware of their rights, responsibilities and welfare of children.

To enhance a conducive teaching and learning environment for teachers and pupils, six classrooms and hygiene facilities are under construction for four communities. Community participation was immense as they provided and cleared the site for the construction. Before the construction of the school, pupils and teachers used temporary structure constructed with local materials and when it rained pupils and teachers did not go to school. The new buildings will provide a more conducive teaching and learning environment for a total number of 300 pupils and 6 teachers upon completion. The ADP also supported training 108 teachers in collaboration with the state education service to improve the quality of education in the area.

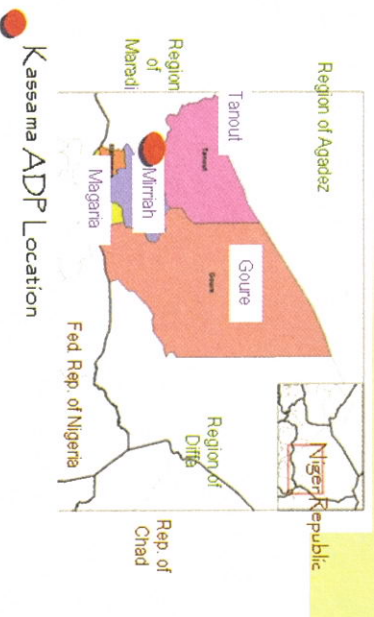

To encourage enrollment of children (especially girls) in schools, a two day sensitization meeting was conducted in the area to raise awareness of community members on the importance of sending children to school. The meeting will hopefully increase enrollment in local schools and remind the community about the importance of women and how they can contribute to development if they are skilled individuals.

To empower the youth with vocational and technical skills, 51 young girls in the area, who previously could not finish school, have been enrolled in vocational training programs at the learning center. Courses being offered there are Dressmaking, Catering, Fashion and Design. None of this could have been possible without you. Thank you so much for your support.
